(54) Title: DETERGENT COMPOSITION

(57) Abstract

An aqueous liquid cleansing and moisturising composition comprising a surface active agent selected from anionic, nonionic, zwitterionic and cationic surface active agents, soap and mixtures thereof; a benefit agent having a weight average particle size in the range 50 to 500 microns; and a thickening agent. The thickening agent is added to the benefit agent in amount from 1 to 50 wt.%, based on the benefit agent.

DETERGENT COMPOSITION

The present invention relates to detergent compositions suitable for care and personal washing of the skin. In particular, it relates to compositions which are formulated to give mild cleansing and conditioning of the skin.

5

10

15

25

30

Compositions formulated to cleanse the skin are well known. It is also known to formulate products which provide both a cleansing and a moisturising benefit.

For example WO 90/13283 discloses a composition comprising an acyl ester of an isethionic acid salt, a long chain fatty acid, a moisturiser component and, optionally, soap

One of the problems which may be encountered with such dual purpose compositions is that, whilst cleansing may be effective, there is an insufficient level of moisturising.

We have found a way of formulating such compositions such that they can deliver effective moisturising, conditioning or protection of the skin.

In WO 94/01085 and 94/01084 the advantage of depositing large particles of petrolatum from soap based compositions is recognised.

However, according to WO 94/03152, concerned with shower gels comprising, a non-soap detergent, silicone oil added to condition the skin and cationic polymers, the maximum average droplet size of the silicone oil that can be used is 2 microns, if product stability is to be maintained.

We have now found that larger particles, by particle is

meant a solid particle or liquid droplet, of benefit agent
can be incorporated into surface active containing

WO 96/02225

10

30

35

-2 -

compositions and effective delivery of the benefit agent can be achieved if the benefit agent is thickened.

PCT/GB95/01690

Thus, according to the invention there is provided an aqueous liquid cleansing and moisturising composition comprising:-

- a) a surface active agent selected from anionic, nonionic, zwitterionic and cationic surface active agents, soap, and mixtures thereof;
- b) an benefit agent having a weight average particle size in the range 50 to 500 microns; and
- 15 c) a thickening agent,

wherein the thickening agent is added to the benefit agent in amount from 1 to 50 wt% based on the benefit agent.

The composition is suitable for cleansing and "moisturising", "conditioning" or "protection" of the skin. The benefit agent is included in the composition to moisturise, condition and/or protect the skin. By "benefit agent" is meant a substance that softens the skin (stratum corneum) and keeps it soft by retarding the decrease of its water content and/or protects the skin.

Preferred benefit agents include

- a) silicone oils, gums and modifications thereof such as linear and cyclic polydimethylsiloxanes; amino, alkyl alkylaryl and aryl silicone oils;
- b) fats and oils including natural fats and oils such as jojoba, soyabean, rice bran, avocado, almond, olive, sesame, persic, castor, coconut, mink oils; cacao fat, beef tallow, lard; hardened oils obtained by hydrogenating the aforementioned

- k) vitamins such as vitamin A and E, and vitamin alkyl esters, including those vitamin C alkyl esters;
- m) Phospholipids; and

5

20

- n) mixtures of any of the foregoing components.
- The benefit agent may be incorporated in a carrier in the compositions of the invention, particularly if it is likely to suffer detrimental interactions with other components of the composition. Benefit agents for which such detrimental interactions may occur include lipids; alkyl lactates; sunscreens; esters such as isopropyl palmitate and isopropyl myristate; and vitamins. The carrier can, for example, be a silicone or hydrocarbon oil which is not solubilised/micellised by the surface active phase and in

Particularly preferred benefit agents include silicone oils, gums and modifications thereof, esters such as isopropyl palmitate and myristate and alkyl lactates.

which the benefit agent is relatively soluble.

The benefit agent is preferably present in amount of from 0.1 to 15 wt%, most preferably from 0.2 to 10 wt%, more preferably from 0.5 to 7 wt%.

An advantage of the composition according to the invention is that, during use, it deposits benefit agent onto the skin at a level which results in a perceivable benefit. Without being bound by theory, it is believed the benefit agent is dispersed into large pools during dilution of the composition in use and these pools deposit readily onto the skin.

5

25

30

In WO 94/01084 and WO 94/01085 the composition are structured by the presence of at least 5% insoluble solid fatty acid soap. However, it is believed that such high levels of solid phase material may adversely affect the amount of benefit agent deposited onto the skin. Thus, in the present invention it is preferred that the composition is substantially free of solid soap, by which is meant the level of solid soap is below 1wt%.

Suitable thickening agents for the benefit agent include polacrylates; fumed silica; natural and synthetic waxes, alkyl silicone waxes such as behenyl silicone wax; aluminium silicate; lanolin derivatives such as lanesterol; higher fatty alcohols; polyethylenecopolymers; narogel; polyammonium stearate; sucrose esters; hydrophobic clays; petrolatum; hydrotalcites; and mixtures thereof.

Hydrotalcites are materials of general formula

20 $\{M_m N_n (OH)_{2(m+n)}\}^{n+} X^{m-}_{n/m} Y H_2 O$

where M is a divalent metal ion e.g. Mg²;
N is a trivalent metal ion e.g. Al³;
X is an exchangeable anion e.g CO, NO, NO, the stearate, cinnimate;
m is the number of divalent metal ions; and n is the number of trivalent metal ions.

Particularly preferred thickening agents for the benefit agent include silica, alkyl silicone waxes, paraffin wax, higher fatty alcohols, petroleum jelly and polyethylenecopolymers.

whilst some materials can function as both a benefit agent and a thickener therefor it will be appreciated that the benefit and thickening function cannot be provided by the

- 6 -

PCT/GB95/01690

same component. However, it will be understood that where the composition comprises two or more benefit agents one of said benefit agents could also function as a thickening agent.

5

25

30

35

WO 96/02225

Preferably the amount of thickening agent is from 4 to 25% wt based on the level of benefit agent.

Although the compositions of the invention may be selfstructuring preferably they will also comprise a
structurant, i.e. a material added to increase the
viscosity at zero shear. Suitable materials include
swelling clays, for example laponite; fatty acids and
derivatives thereof and, in particular fatty acid
monoglyceride polyglycol ethers; cross-linked polyacrylates
such as Carbopol (TM) (polymers available from Goodrich);
acrylates and copolymers thereof, polyvinylpyrrolidone and
copolymers thereof; polyethylene imines; salts such as
sodium chloride and ammonium sulphate; sucrose esters;
gellants; and mixtures thereof.

Of the clays particularly preferred are synthetic hectorite (laponite) clay used in conjunction with an electrolyte salt capable of causing the clay to thicken. Suitable electrolytes include alkali and alkaline earth salts such as halides, ammonium salts and sulphates.

The compositions according to the invention may also comprise a thickening agent in addition to the thickening agent added to the benefit agent, i.e. a material which maintains the viscosity of the composition as the shear rate thereof is increased during use. Suitable materials include cross-linked polyacrylates such as Carbopol (TM) (polymers available from Goodrich); fatty acids and derivatives thereof and, in particular, fatty acid monoglyceride polyglycol ethers; natural gums including

5

10

15

25

30

35

alginates, guar, xanthan and polysaccharide derivatives including carboxy methyl cellulose and hydroxypropyl guar; propylene glycols and propylene glycol oleates; salts such as sodium chloride and ammonium sulphate; glycerol tallowates; and mixtures thereof.

Further examples of structurants and thickeners are given in the International Cosmetic Ingredient Dictionary, Fifth Edition, 1993, published by CTFA (The Cosmetic, Toiletry & Fragrance Association), incorporated herein by reference.

The surface active agent can be selected from any known surfactant suitable for topical application to the human body. Mild surfactants, i.e. surfactants which do not damage the stratum corneum, the outer layer of skin, are particularly preferred.

One preferred anionic detergent is fatty acyl isethionate of formula:

20 RCO₂CH₂CH₂SO₃M

where R is an alkyl or alkenyl group of 7 to 21 carbon atoms and M is a solubilising cation such as sodium, potassium, ammonium or substituted ammonium. Preferably at least three quarters of the RCO groups have 12 to 18 carbon atoms and may be derived from coconut, palm or a coconut/palm blend.

Another preferred anionic detergent is alkyl ether sulphate of formula:

RO(CH2CH2O) SOM

where R is an alkyl group of 8 to 22 carbon atoms, n ranges from 0.5 to 10, especially from 1.5 to 8, and M is a solubilising cation as defined above.

WO 96/02225

Other possibl anionic detergents include alkyl glyceryl ether sulphate, sulphosuccinates, taurates, sarcosinates, sulphoacetates, alkyl phosphate, alkyl phosphate esters and acyl lactylate, alkyl glutamates and mixtures thereof.

5

Sulphosuccinates may be monoalkyl sulphosuccinates having the formula: $R^5O_3CCH_2CH(SO_3M)CO_2M$; and amido-MEA sulphosuccinates of the formula: $R^5CONHCH_2CH_2O_3CCH_2CH(SO_3M)CO_2M$; wherein R^5 ranges from C_3-C_{20}

10

15

20

35

R*CONHCH₂CH₂O₂CCH₂CH(SO₂M)CO₂M; wherein R* ranges from C_3 - C_{20} alkyl, preferably C_{12} - C_{15} alkyl and M is a solubilising cation.

Sarcosinates are generally indicated by the formula: $R^5CON(CH_3)CH_2CO_2M$, wherein R^5 ranges from C_6-C_{20} alkyl, preferably $C_{12}-C_{15}$ alkyl and M is a solubilising cation.

Taurates are generally identified by the formula: $R^5CONR^6CH_2CH_2SO_2M$, wherein R^5 ranges from C_5-C_{20} alkyl, preferably $C_{12}-C_{15}$ alkyl, R^6 ranges from C_1-C_4 alkyl, and M is a solubilising cation.

Harsh surfactants such as primary alkane sulphonate or alkyl benzene sulphonate will generally be avoided.

Suitable nonionic surface active agents include alkyl polysaccharides, lactobionamides, ethyleneglycol esters, glycerol monoethers, polyhydroxyamides (glucamide), primary and secondary alcohol ethoxylates, especially the C_{6-20} aliphatic alcohols ethoxylated with an average of from 1 to 20 moles of ethylene oxide per mole of alcohol.

If the surface active agent comprises soap, the soap is preferably derived from materials with a C_0 to C_{12} substantially saturated carbon chain and, preferably, is a potassium soap with a C_{12} to C_{19} carbon chain.

Mixtures of any of the foregoing surface active agents may also be used.

The surface active agent is preferably present at a level of from 1 to 35 wt%, preferably 3 to 30 wt%.

It is also preferable that the composition includes from 0.5 to 15 wt% of a cosurfactant agent with skin-mildness benefits. Suitable materials are zwitterionic detergents which have an alkyl or alkenyl group of 7 to 18 carbon atoms and comply with an overall structural formula:-

O
$$\mathbb{R}^{1}$$

|| (CH₂)_m-]_n-N^{*}-X-Y

20

5

10

15

where R^1 is alkyl or alkenyl of 7 to 18 carbon atoms; R^2 and R^3 are each independently alkyl, hydroxyalkyl or carboxyalkyl of 1 to 3 carbon atoms;

25

m is 2 to 4; n is 0 or 1; X is alkylene of 1 to 3 carbon atoms optionally substituted with hydroxyl, and Y is -CO₂ or -SO₃.

30

Zwitterionic detergents within the above general formula include simple betaines of formula:-

40

35

and amido becaines of formula:

where m is 2 or 3.

In both formulae R^1 , R^2 and R^3 are as defined previously. R^1 may, in particular, be a mixture of C_{12} and C_{14} alkyl groups derived from coconut so that at least half, preferably, at least three quarter of the groups R^1 has 10 to 14 carbon atoms. R^2 and R^3 are preferably methyl.

A further possibility is a sulphobetaine of formula:-

15

10

5

20

25

where m is 2 or 3, or variants of these in which $-(CH_2)_3SO_2^{-1}$ is replaced by

30

 R^1 , R^2 and R^3 in these formulae are as defined previously.

Furthermore, the benefit agent may also function as a carrier to deliver efficacy agents to skin treated with the compositions of the invention. This route is particularly useful for delivering efficacy agents which are difficult to deposit onto the skin or those which suffer detrimental interactions with other components in the composition. In such cases the carrier is a often a silicone or hydrocarbon

- 11 -

oil which is not solubilised/micellised by the surface active phase and in which the efficacy agent is relatively soluble. Examples of such efficacy agents include antiviral agents; hydroxycaprylic acids; pyrrolidone; carboxylic acids; 2,4,4'-trichloro-2'-hydroxydiphenyl ether (Irgasan DP300); 3,4,4'-trichlorocarbanilide; salicylic acid; benzoyl peroxide; perfumes; essential oils; germicides and insect repellants such as N,N-dimethyl m-toluamide (DEET); and mixtures thereof.

10

15

20

25

30

5

Compositions of the invention may be formulated as products for washing the skin, for example bath or shower gels, hand washing compositions, facial washing liquids; pre-and post-shaving products; rinse-off, wipe-off and leave-on skin-care products.

The compositions of the invention will generally be pourable liquids or semi-liquids eg pastes and will preferably have a viscosity in the range 1000 to 100,000 mpas measured at a shear rate 10s and 25°C in a Haake Rotoviscometer RV20.

The compositions of the invention will preferably exhibit a Newtonian viscosity at a shear stress of 0.01 Pa, at 25°C, of at least 5,000 Pas, preferably greater than 10,000 Pas.

The above-mentioned characteristic viscosity measurements may be determined exactly (as in the case of the non-zero shear viscosities) using, for example a Carrimed CSL 100 low stress rheometer or obtained from an extrapolation according to the Cross Model, (see J of the Chemical Engineer, 1993, paper entitled "Rheology for the Chemical Engineer" by H Barnes) as in the case of zero shear rate.

Other typical components of the compositions include opacifiers, preferably 0.2 to 2.0 wt%; preservatives,

- 12 -

PCT/GB95/01690

preferably 0.2 to 2.0 wt% and perfumes, preferably 0.5 to 2.0 wt%.

- According to a further aspect of the invention there is provided a process for preparing compositions according to the invention comprising:
 - a) forming a base composition comprising at least one surface active agent selected from anionic, nonionic, zwitterionic and cationic surface active agents, soap and mixtures thereof;
 - b) adding a thickening agent to the benefit agent in an amount from 1 to 50%wt, based on the benefit agent; and
 - c) mixing the base formulation of step a) with the benefit agent.
- The invention will be further illustrated by reference to the following non-limiting examples.

Examples

10

15

WO 96/02225

- 25 In the examples:-
 - Alkylpolyglucoside was Plantaren 2000 ex Henkel Behenyl alcohol was Nacol 22-97 ex Condea. Behenyl silicone wax was Cire 71649 ex Rhone Poulenc. Coco amidopropyl betaine was Amonyl BA 380 ex Seppic.
- Cross-linked polyacrylate was Carbopol ETD 2020 ex Goodrich.
 - Guar hydroxypropyl trimonium chloride was Jaguar C-13-S ex Meyhall.
- Hydrotalcite was hydrotalcite containing IPP, Multigel IPP

 35 ex Guilini Chemie GmbH

 IPP (isopropyl palmitate) was ESTOL 1517 ex Unichema.

- 13 -

Lauryl lactate was Crodamol LL ex Croda Chemicals. MEA suphosuccinate was witco 5690 ex Witco.

Polyethylene AC617 was from A-C Performance Additives.

Silica was a hydrophobically modified silica, Aerosil R972

5 ex Degussa.

The silicone oils were all DC200, a polydimethylsiloxane ex Dow Corning, but with a varying viscosities as stated below.

Silicone oil emulsion was BC 92/057 ex Basildon.

10 Sodium lauryl ether sulphate was Genapol ZRO ex Hoechst

Example I

20

25

35

In this example, the effect of thickening a silicone oil benefit agent with silica on the deposition of silicone oil onto the skin was examined.

The following method was used to determine the amount of benefit agent deposited onto full thickness porcine skin (5 x 15 cm) treated with compositions according to the invention.

The skin was prehydrated and then 0.5 ml of the product applied to it. The product was lathered for 10 seconds and then rinsed for 10 seconds under running water.

Thereafter the skin was wiped once with a paper towel to remove excess water.

2 minutes after drying a strip of adhesive tape was pressed onto the skin for 30 seconds by applying a constant load of 100g.cm. The adhesive tape employed was J-Lar Superclear (TM) tape having a width of 2.5cm. In total ten strips of tape were applied to adjacent sites on the skin.

W 96/02225

20

- 14 -

In this test procedure silicone which has deposited on th skin will subsequently be transferred to the tape along with some of the outer layer of the skin.

The amounts of silicon and skin adhering to the tape are determined by means of X-ray fluorescence spectroscopy. The tape strips are placed in an X-ray fluorescence spectrometer with the adhesive side facing the beam of this machine. A mask is applied over the tape to define a standardised area in the middle of the tape which is exposed to the X-ray beam. The sample chamber of the machine is placed under vacuum before making measurements and the spectrometer is then used to measure the quantities of silicon and sulphur. The sulphur is representative of the amount of skin which has transferred to the tape.

The amounts of silicon and sulphur observed with a clean piece of adhesive tape are subtracted from the experimental measurements. The experimental measurements for the average levels of sulphur and silicon are expressed as a ratio of silicon to sulphur. From this ratio it is possible to determine silicone oil deposition per unit area of skin.

A base shower gel formulation having the following composition was prepared.

| | | <u>* Wt</u> |
|----|----------------------------------|-------------|
| | Sodium lauryl ether sulphate | 4.00 |
| | Sodium coco amido propyl betaine | 1.00 |
| 30 | Alkylpolyglucoside | 5.00 |
| | Sorbic acid | 0.37 |
| | Trisodium citrate dihydrate | 0.49 |
| | Cross-linked polyacrylate | 0.9 |
| | Thickener* | ~1 |
| 35 | 5N NaOH" | ~1 |
| • | Water + minors | to 100 |
| | | |

- 15 -

* Thickener added to give the required viscosity (\sim 5000mPas at $10s^{-1}$ and 25° C)

** NaOH was added to adjust the pH of the composition to pH 5.3.

5

The composition was prepared by dispersing the polyacrylate in excess water. Thereafter sorbic acid and trisodium citrate dihydrate were added to the resulting polymer dispersion. The three surface active agents were mixed and the resulting mix added to the polymer dispersion. Thereafter minors were added. The viscosity of the resulting composition was measured at a shear rate of 10s⁻¹ at 25°C and thickener added until the required viscosity obtained.

15

20

25

10

Two Harvard 44 syringe pumps were used to infuse the base formulation and the benefit agent, silicone oil. Silicone oil was present at a level of 5 wt% based on the total composition. One syringe was filled with the base formulation and the other with silicone oil. The syringes were then inserted into the syringe pump and the infusion rate set at 5:95 oil:base. The oil and base were forced through a static in-line mixer and a composition with oil particles of the required size obtained. The size of the particles can be controlled by the diameter of the static mixer, the flow rate and length of the mixer tube. The size of the particles can be determined using a Malvern Mastersizer.

30

Silicone deposition from the compositions according to the invention was measured by the test procedure described above and compared with that from a similar composition (A) comprising a silicone oil emulsion having a viscosity of 60000 mPas at 10s⁻¹ and 25°C.

35

. - 16 -

Comparative Composition (Composition A)

| | | 3WE |
|----|---------------------------------|--------|
| 5 | Sodium lauryl ether sulphate | 13.00 |
| | Coco amidopropyl betaine (CAPB) | 2.00 |
| | Silicone oil emulsion | 5.00 |
| | Guar hydroxypropyl trimonium | 0.10 |
| | chloride | |
| 10 | Sorbic acid | 0.37 |

| | Sodium chloride' | ~2 |
| | Citric acid** | ~0.01 |
| | Water + minors | to 100 |
| | | |

15

The following results were obtained.

| | _ | Silica dded | Si:S ratio | particle Size/um |
|----|------------|----------------|---------------|---------------------|
| | Comparison | 0 | 0.9 | 0.5 |
| 25 | Ia | 8.3 | 63.9 | 424 |
| | Ib | 9.7 | 22.2 | 354 |
| | Ic | 4.7 | 21.3 | 341 |
| | Id | 6.1 | 11.5 | 289 |

The results demonstrate the advantage, in terms of deposition of silicone, using a composition comprising a thickened silicone oil over a composition comprising a unthickened silicone oil.

[#] level can be varied in order to give the required viscosity of 5000 mPas at 10s⁻¹ and 25°C.

^{##} level can be varied in order to give the required pH.

Example II

Example I was repeated except that the benefit agent used was IPP (isopropylpalmitate). The IPP was thickened with three different thickeners at a level of 10% by weight based on the IPP.

The following method was used to determine the amount of IPP deposited onto full thickness porcine skin (5 x 15cm pieces) treated with compositions according to the invention. The skin was treated and washed with the compositions according to the invention by the same method as described for example I. Thereafter the skin was extracted with ethanol three times (3 ml per extract) and the extract made up to 10g and submitted for Gas Chromatography analysis to determine the amount of IPP deposited.

The following results were obtained:-

20

25

35

15

5

10

| thickener | deposition/ppm |
|----------------------|----------------|
| none | 6.1 |
| polyethylene AC617 | 441.9 |
| behenyl silicone wax | k 138.1 |
| hydrotalcite | 59.1 |

The results demonstrate the increased deposition of IPP obtained when the IPP is thickened.

30 Example III

In this example the benefit agent used was lauryl lactate.

The following method was used to determine the amount of lauryl lactate deposited onto skin treated with compositions according to the invention containing lauryl lactate.

Porcine full thickness skin was prehydrated and then 0.20g of the product and 0.8g of water applied to it. was washed for 30 seconds and then rinsed for 10 seconds under running water.

- 18 -

PCT/GB95/01690

5

WO 96/02225

Thereafter the skin was wiped once with a paper towel to remove excess water. 30 seconds after drying 5 strips of Desquame tape were applied to the skin sequentially for 10 seconds.

10

15

20

The strips were then removed from the skin and hydrolysed in 2ml of NaOH (0.5M) at 60°C for 60 minutes. They were then neutralised with 2ml HCl (0.5M) and in Sorensens phosphate buffer (pH 7.0). The total lauryl lactate and the protein content of the tapes, representative of the lauryl lactate transferred to the skin, was determined using Sigma diagnostic assay Kits 735/10 and 690. A solution containing the assay and treated strips was prepared and the absorbance at 540nm measured in a UV spectrometer.

The base formulation for the following experiments was:-

7.74 G

| | | WC 5 |
|----|---------------------------|--------|
| 25 | MEA sulphosuccinate | 11.7 |
| | Cross-linked polyacrylate | 0.3 |
| | Sodium cocoyl isethionate | 8.5 |
| | Coco amidopropyl betaine | 15.8 |
| | Water and minors | to 100 |

30

It was prepared by dispersing the polyacrylate in excess water. A premix of the three surfactants was then added to the polymer dispersion. Thereafter minors were added.

The following benefit agent/thickener combination was 35 used: -

10

15

30

| | | | <u>₩Ľ\$</u> | Droplet size/um |
|---|---|-----------------------------------|-------------|--------------------|
| 5 | x | Lauryl lactate Polyethylene AC617 | 85 15 | 172.2 |

The mixture X was prepared by heating the two components together to a temperature of ~110°C to melt in the polyethylene. The mixture was then allowed to cool before being used.

An emulsion of the base formulation and thickened benefit agent, was applied to the skin using the test procedure described above.

The following results were obtained:-

| | | te/Absorbance |
|----|--------------------------------------|---------------|
| 20 | Untreated skin | 81 |
| | base formulation (no lauryl lactate) | 63 |
| | base + 5%'X | 128 |
| | base + 5% lauryl lactate | 102 |
| | base + 10%*X | 154 |
| 25 | base + 10% lauryl lactate | 107 |
| | * based on the total composition | |

In a separate set of experiments, but with the same base formulation as described above, the effect of a range of thickening agents (all at a level of 5%wt based on the lauryl lactate) on the deposition of lauryl lactate was examined. The lauryl lactate or thickened lauryl lactate was added to the base formulation at a level of 5wt%.

lactate/Absorbance

| | | units $(x10^{-3})$ |
|---|----------------------------------|--------------------|
| | lauryl lactate (no thickener) | 112 |
| | lauryl lactate + paraffin wax | 148 |
| 5 | lauryl lactate + behenyl alcohol | 152 |
| | lauryl lactate + petroleum jelly | 148 |
| | lauryl lactate + polyethylene AC | 617 129 |
| | lauryl lactate + behenyl silicon | e wax 167 |
| | | |

The results demonstrate the benefit of thickening the benefit agent with a thickening agent

- 21 -

CLAIMS

1. An aqueous liquid cleansing and moisturising composition comprising:-

5

 a) a surface active agent selected from anionic, nonionic, zwitterionic and cationic surface active agents, soap and mixtures thereof;

10

- b) an benefit agent having a weight average particle size in the range 50 to 500 microns; and
- c) a thickening agent.

15

wherein the thickening agent is added to the benefit agent in amount from 1 to 50%wt, based on the benefit agent.

20

2. A composition according to claim 1 wherein the thickening agent is selected from polyacrylates; silica, natural and synthetic waxes, alkyl silicone waxes; aluminium silicate; lanolin derivatives; higher fatty alcohols; polyethylenecopolymers; narogel; polyammonium stearate; sucrose esters; hydrophobic clays; petrolatum; hydrotalcites; and mixtures thereof.

25

3. A composition according to claim 1 wherein the composition is structured with a surfactant selected from swelling clays; fatty acid and derivatives thereof; crosslinked polyacrylates; acrylates and copolymers thereof; polyvinylpyrrolidone and copolymers thereof; polyethylene imines; salts; sucrose esters; gellants; and mixtures thereof.

30

35

4. A composition according to claim 1 wherein the benefit agent is selected from silicone oils; gums; fats; oils; waxes; hydrophobic plant extracts; hydrocarbons; fatty

acids; alcohols; esters; essential oils; lipids; phospholipids; vitamins; sunscreens; and mixtures thereof.

- 5. A composition according to any one of the preceding claims comprising 0.1 to 15 wt% of the benefit agent.
 - 6. A composition according to any one of the preceding claims wherein the benefit agent functions as a carrier to deliver efficacy agents to skin treated with the composition.
 - 7. A composition according to any one of the preceding claims comprising 1 to 35 wt% of the surface active agent.
- 8. A composition according to any one of the preceding claims further comprising a cosurfactant selected from betaines, amidobetaines and sulphobetaines.

10

25

- 9. A process for preparing a composition according to claim 1 comprises:
 - a) forming a base composition comprising at least one surface active agent selected from anionic, nonionic, zwitterionic and cationic surface active agents, soap and mixtures thereof;
 - b) adding a thickening agent to the benefit agent in an amount from 1 to 50 wt%, based on the benefit agent; and
- 30 c) mixing the base formulation of step a) with the benefit agent.
- 10. A method of depositing a benefit agent from an aqueous liquid cleansing and moisturising composition, the method comprising providing the said benefit agent in a composition comprising;

- 23 -

- a surface active agent selected from anionic,
 nonionic, zwitterionic and cationic surface active agents,
 soap and mixtures thereof;
- 5 b) an benefit agent having a weight average particle size in the range 50 to 500 microns; and

10

c) a thickening agent, and wherein the thickening agent is added to the benefit agent in amount from 1 to 50% wt. based on the benefit agent.
